CASE SUMMARY

This is regarding Mr. Alwin Thomas, aged 5 years (Hosp.No. 776564), who is an old case of autoimmune encephalitis (CASPR 2) at the age of 1-year followed by seizure disorder, developmental delay and squinting. Ophthalmic examination revealed right convergent squint going into alternate convergent squint. Rest of his ocular examination was within normal limits. He was started on part-time occlusion therapy 2 hours/day in the left eye along with glasses. Patient was kept under periodic follow up and on 06/06/2023, there was worsening of squinting noted. So he was advised squint surgery in the right eye under general anaesthesia after paediatric clearance. Subsequently he underwent medial rectus recession with the lateral rectus resection in the right eye under general anaesthesia on 18/09/2023. Perioperatively, he was noted to have cafe au lait spots on the back and axilla and lisch nodules in the iris in both eyes, so he was advised Neurology consultation to rule out neurofibromatosis. He was last seen here on 14/12/2023. He was doing well and continued on occlusion therapy and glasses. The parents were counseled regarding the need for neurology consultation. Patient has not come for any follow up after that.
