

# KRISHNA ADVANCED M.R.I & C.T

## IMPRESSION:

- ❖ Post op left fronto-temporal region craniotomy changes.
- ❖ Confluent cystic encephalomalacic changes with subjacent gliosis involving right fronto-temporal lobes and parieto-occipital lobe predominantly involving cortices, subjacent subcortical whitematter with exvaccuo-dilatation of right lateral ventricle - Sequel of prior ischemic insult.
- ❖ Confluent cystic encephalomalacic changes with subjacent gliosis involving left parieto-occipital lobes with mild exvaccuo-dilatation in left lateral ventricle.
- ❖ There is increased T2, FLAIR signal lesion with no restricted diffusion in posterior limb of internal capsules, cerebral peduncles, centre of pons, cerebellar whitematter.
- ❖ MRA shows severe narrowing and nonvisualisation of intracranial segment of right ICA. There is severe narrowing in intracranial segment of left ICA. There are numerous collateral vessels along both fronto-temporal lobe region surfaces(L>R).
- ❖ Both MCA's appear severely attenuated/narrowed.
- ❖ Left vertebral artery is hypoplastic. Distal basilar artery appears narrowed with significant narrowing in left PCA and nonvisualisation of right PCA.
