Test Description	Value Observed	Biological Reference Interval
------------------	----------------	-------------------------------

DEPARTMENT OF HORMONES

25 HYDROXY VITAMIN D

39.63 ng/ml

Deficient: < 20 ng/ml
Insufficient: 20-29 ng/ml
Sufficient: 30-100 ng/ml
Potential toxicity:
> 100 ng/ml

Notes

Test: 25 HYDROXY VITAMIN D Sample: Serum Method: Electrochemiluminescence
Vitamin D is essential for bone health. In children, severe deficiency leads to bone-malformation, known as rickets. Milder degrees of insufficiency are believed to cause reduced efficiency in the utilization of dietary calcium. Vitamin D deficiency causes muscle weakness; in elderly, the risk of falling has been attributed to the effect of vitamin D on muscle function. Samples should not be taken from patients receiving therapy with high biotin doses until at least 8 hours following the last biotin administration.
H-High L-Low
